

FIXTURE - Global Casting

Top quality welding work

Linattech has manufactured a new fixture for Global Castings. The fixture will be used when large items are to be transported into and out of the paint booth. The item is mounted on the fixture which can subsequently be lifted by a forklift and thus driven in and out of the paint booth.

The fixture is manufactured in steel and produced in compliance with high quality requirements, with this work subsequently receiving approval in compliance with the requirements for EN/ISO 1090-2 via an external visual 100 % approval of all welding work.

As the name implies, Global Castings maintains branches at several locations worldwide, including Denmark where it primarily produces large components for the wind turbine industry in the form of machining and surface treatment.

Linattech has previously supplied transportation equipment to the company, and was thus solicited for this assignment. The task of creating a new fixture has been a pure manufacturing project, though since those at Global Castings have been extremely satisfied with the delivery, quality and correspondence, Linattech has subsequently received maintenance assignments and queries regarding the development and manufacture of a mover for Global Castings' fixture and hub.
